**Amphibian breeding areas**

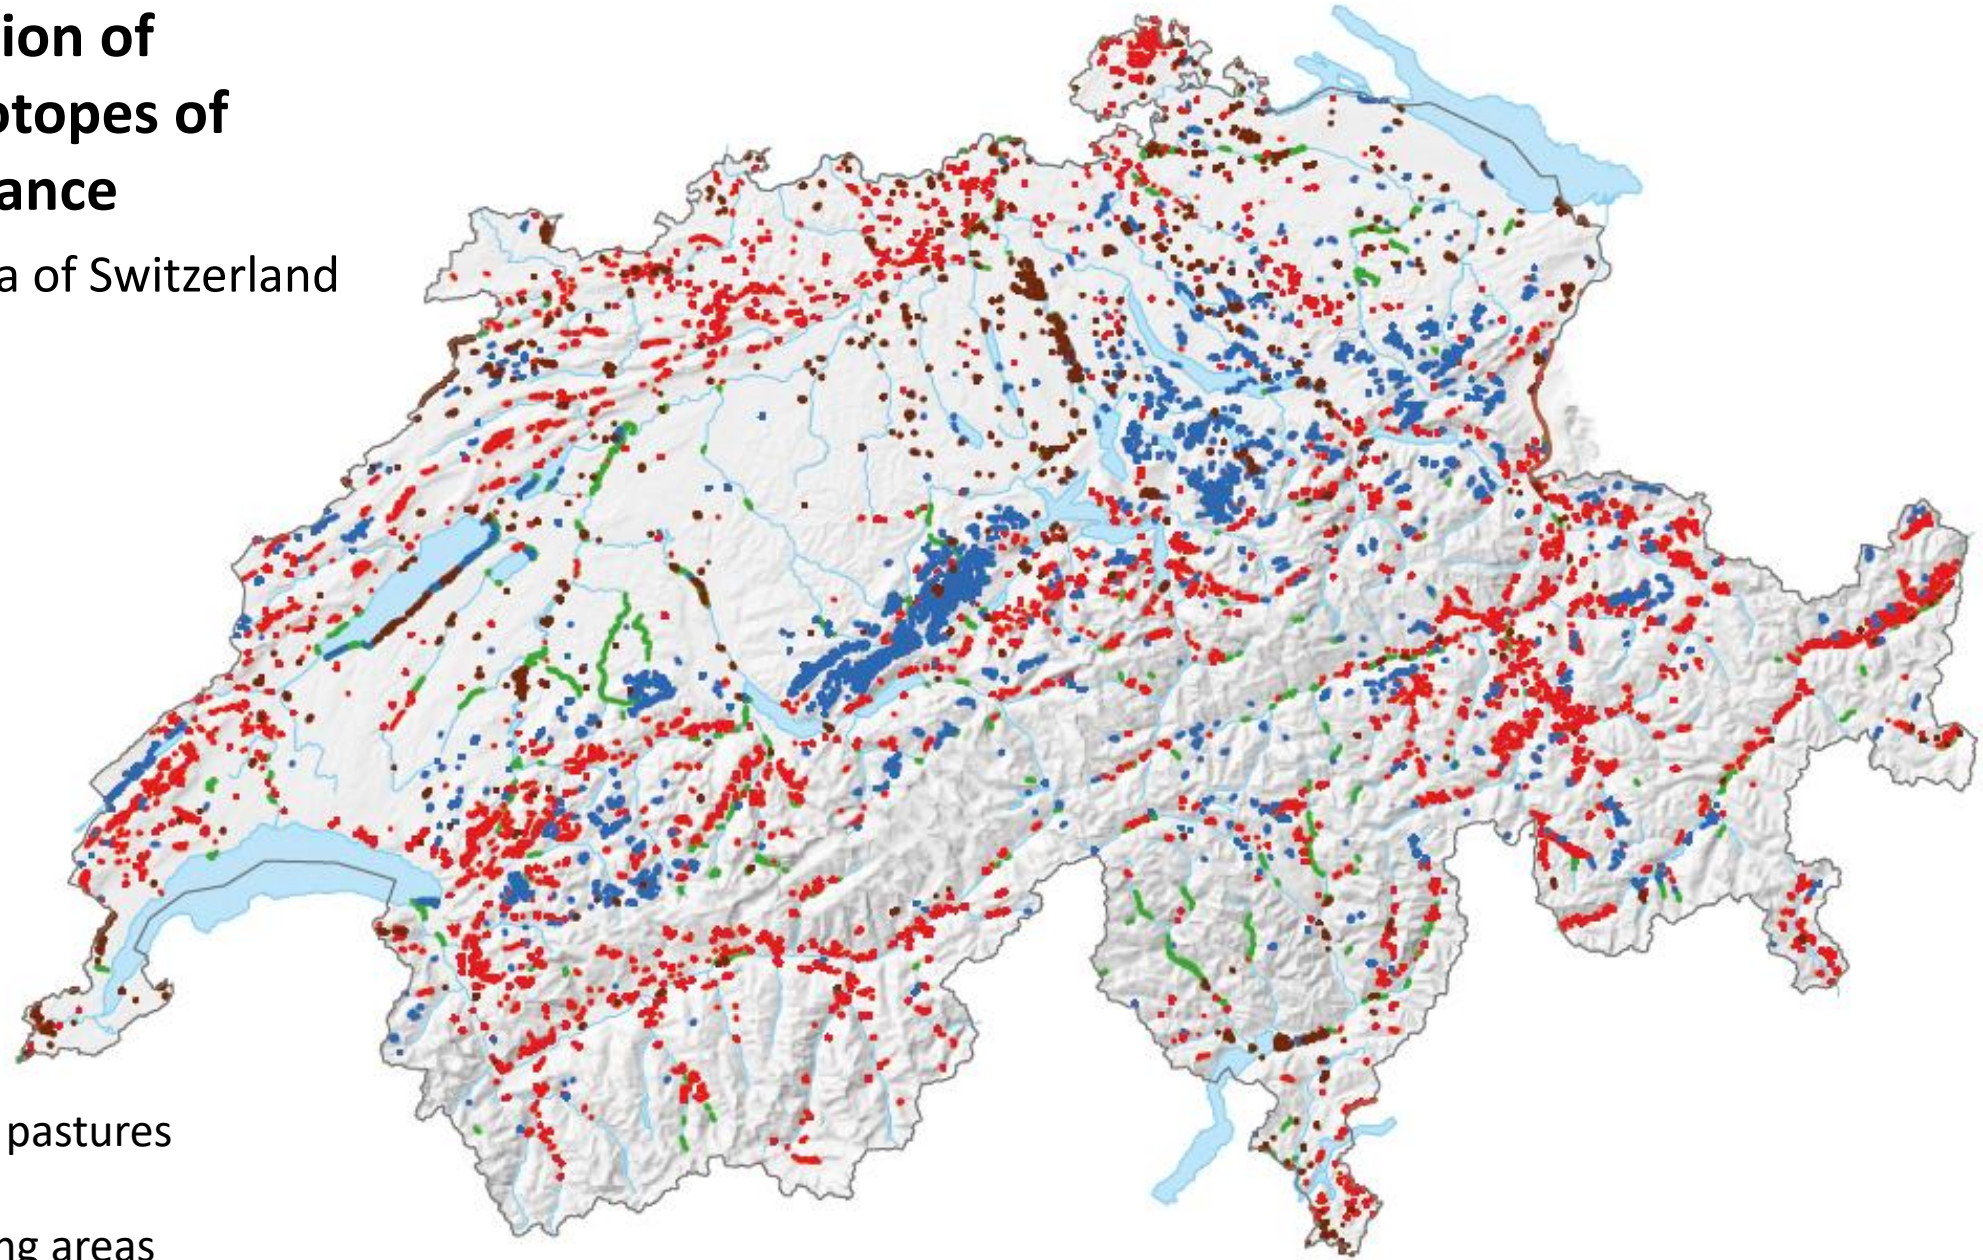

**Amphibian breeding areas**

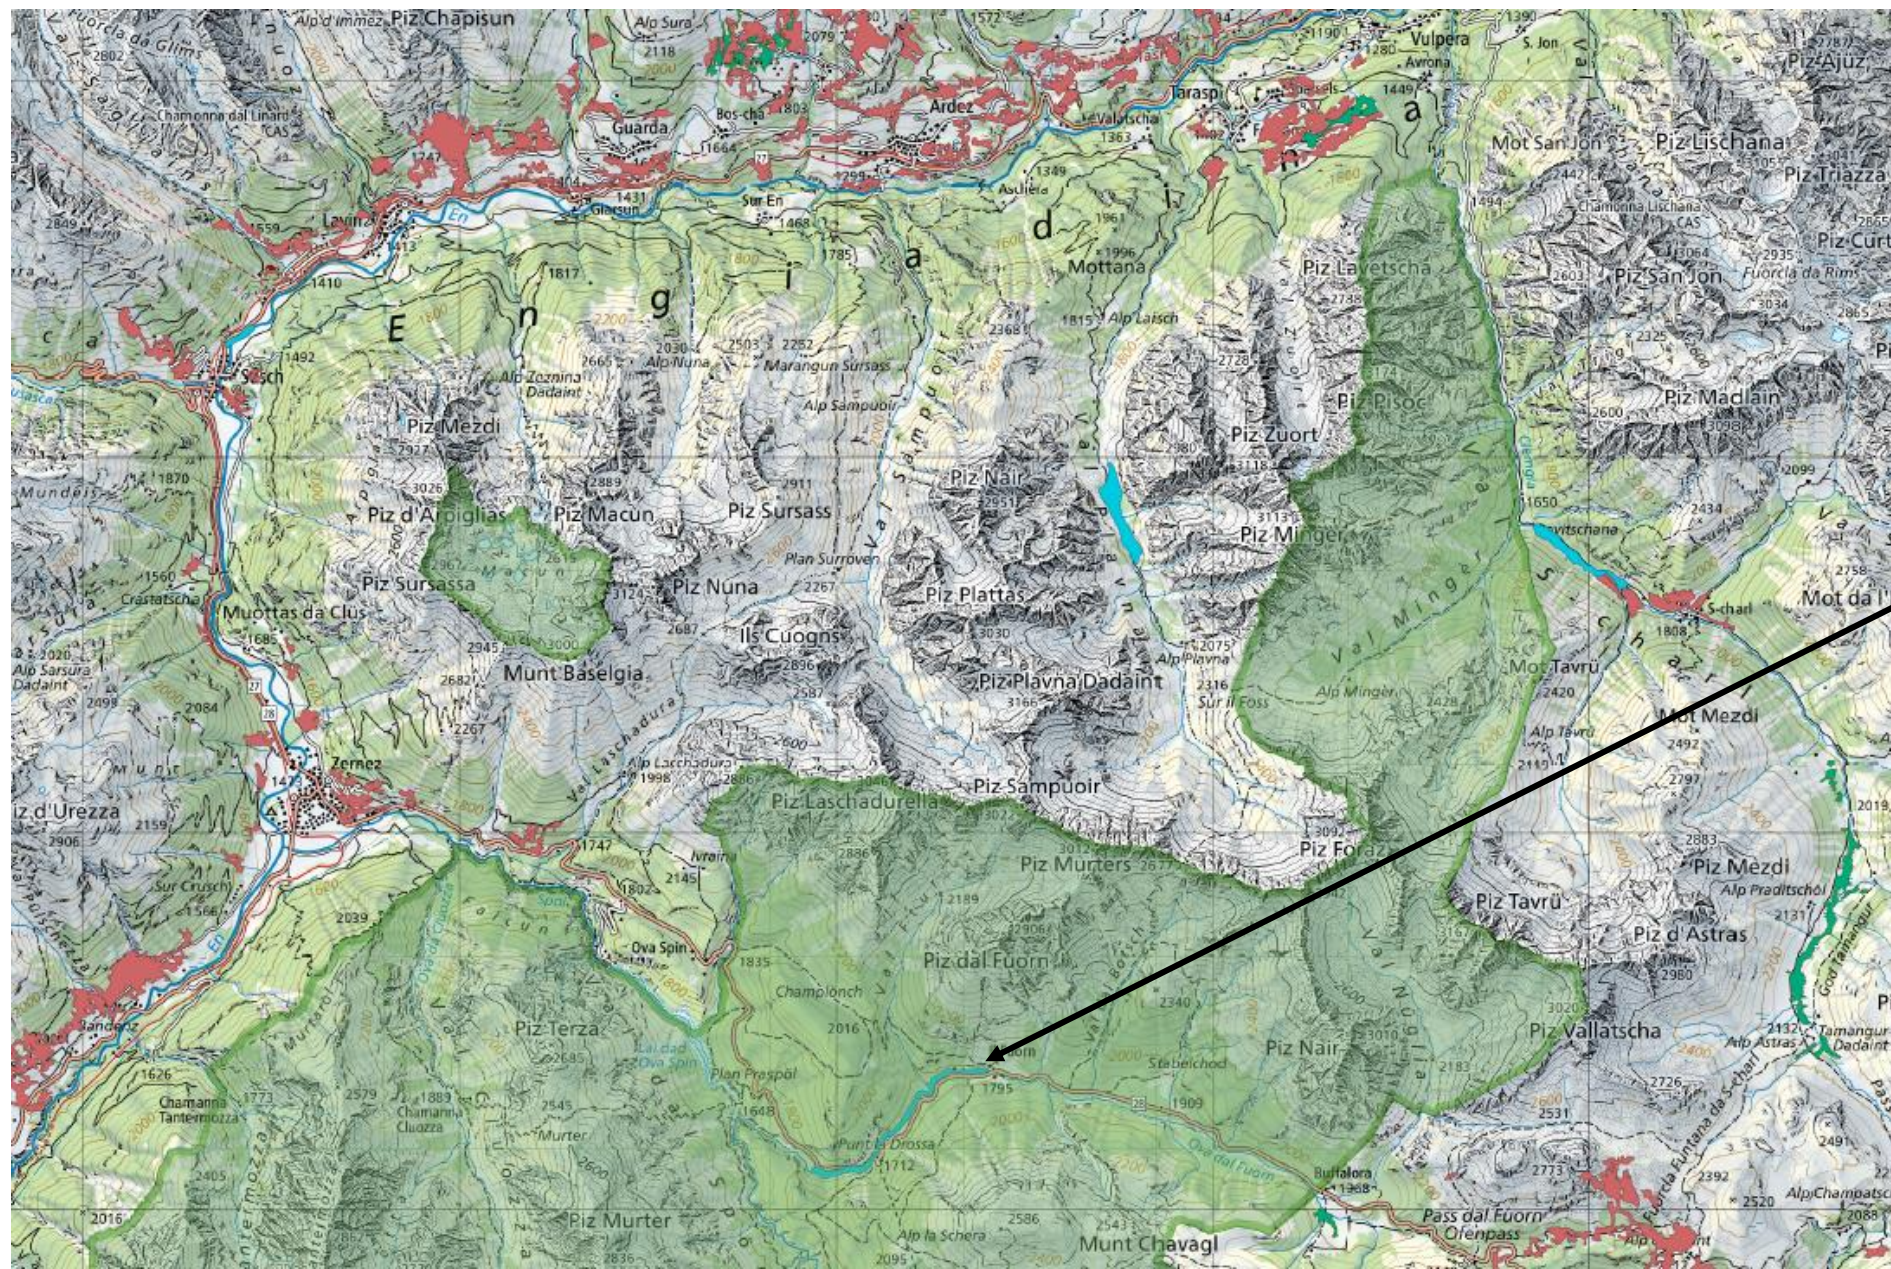

## Spatial distribution of 7000 sites of biotopes of national importance

⇒ 2.27% of the area of Switzerland

- Dry meadows and pastures
- Fens and bogs
- Amphibian breeding areas
- Alluvial areas (incl. glacier forfields)

Alluvial area  
'Ova dal Fuorn'

# Monitoring the Effectiveness of Habitat Conservation in Switzerland (WBS)

Schweizerische Eidgenossenschaft  
Confédération suisse  
Confederazione Svizzera  
Confederaziun svizra

**Federal Office for the Environment  
FOEN**

⇒ **Initiated** in 2011 as a long-term monitoring project by the Federal Office for the Environment and conducted by WSL (Swiss Federal Research Institute for Forest, Snow and Landscape Research)

⇒ **Main goal:**

**Estimation of trends in quality and quantity of the biotops of national importance:**

Are the biotopes of national importance (dry grasslands, fens, bogs, floodplains, amphibian breeding areas) developing according to their conservation targets?

**Module**  
**Remote sensing**

# Vegetation surveys

	Objects	Plots
Alluvial areas	124	2150
Fens and bogs	242	2180
Dry meadows and pastures	444	2780
<b>Total</b>	<b>810</b>	<b>7110</b>

- Complex sampling design: Two-stage sampling design with unequal probability sampling and sample spreading in ecological and geographic space (Tillé, Y. & Ecker, K. 2014. Environmental and Ecological Statistics)
- Each plot 10 m<sup>2</sup>, circular (radius = 1.78 m); in alluvial areas an additional circular plot of 200 m<sup>2</sup> is recorded to get a more complete sample of woody plants
- Complete list of vascular plants together with cover estimates; in bogs and fens also bryophytes are recorded
- Every 6 years the same plot is recorded again

# Main indicators derived from vegetation surveys

- **Changes in mean indicator values:** nutrients, moisture, light, temperature
- **Changes in species numbers:** Red List species, neophytes, habitats specialists, national priority species
- **Changes in the area of typical habitats**

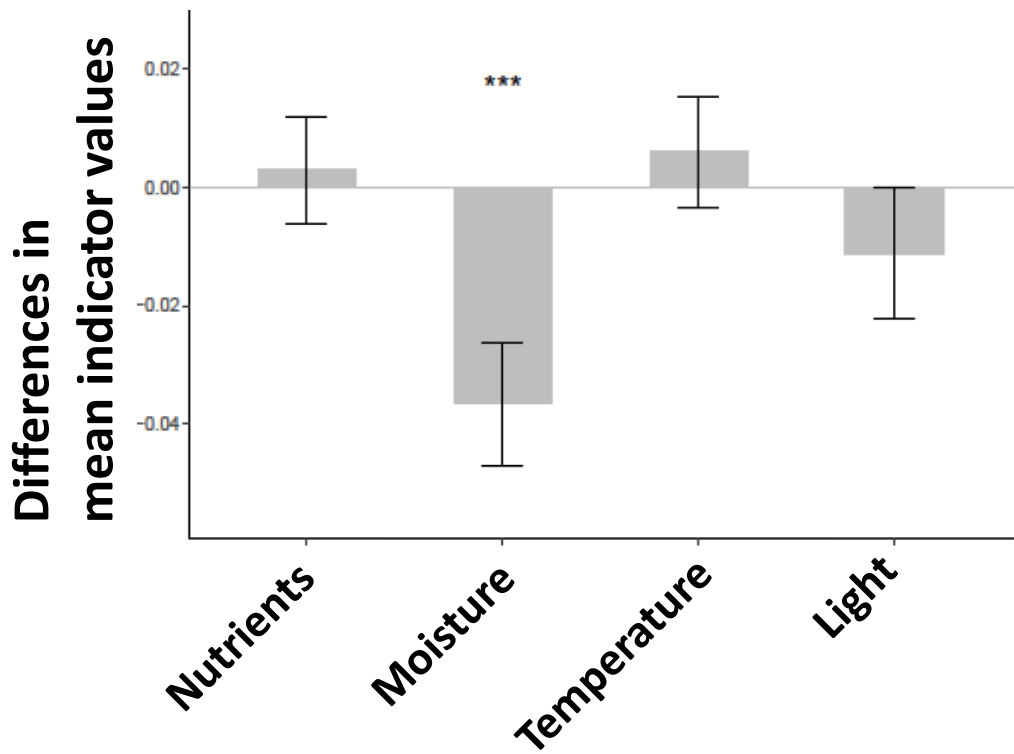

## Changes in

- ⇒ ecological conditions
- ⇒ nature conservation values

# Examples of preliminary results

Fens

Changes of the area (km<sup>2</sup>) of vegetation types in dry meadows and pastures

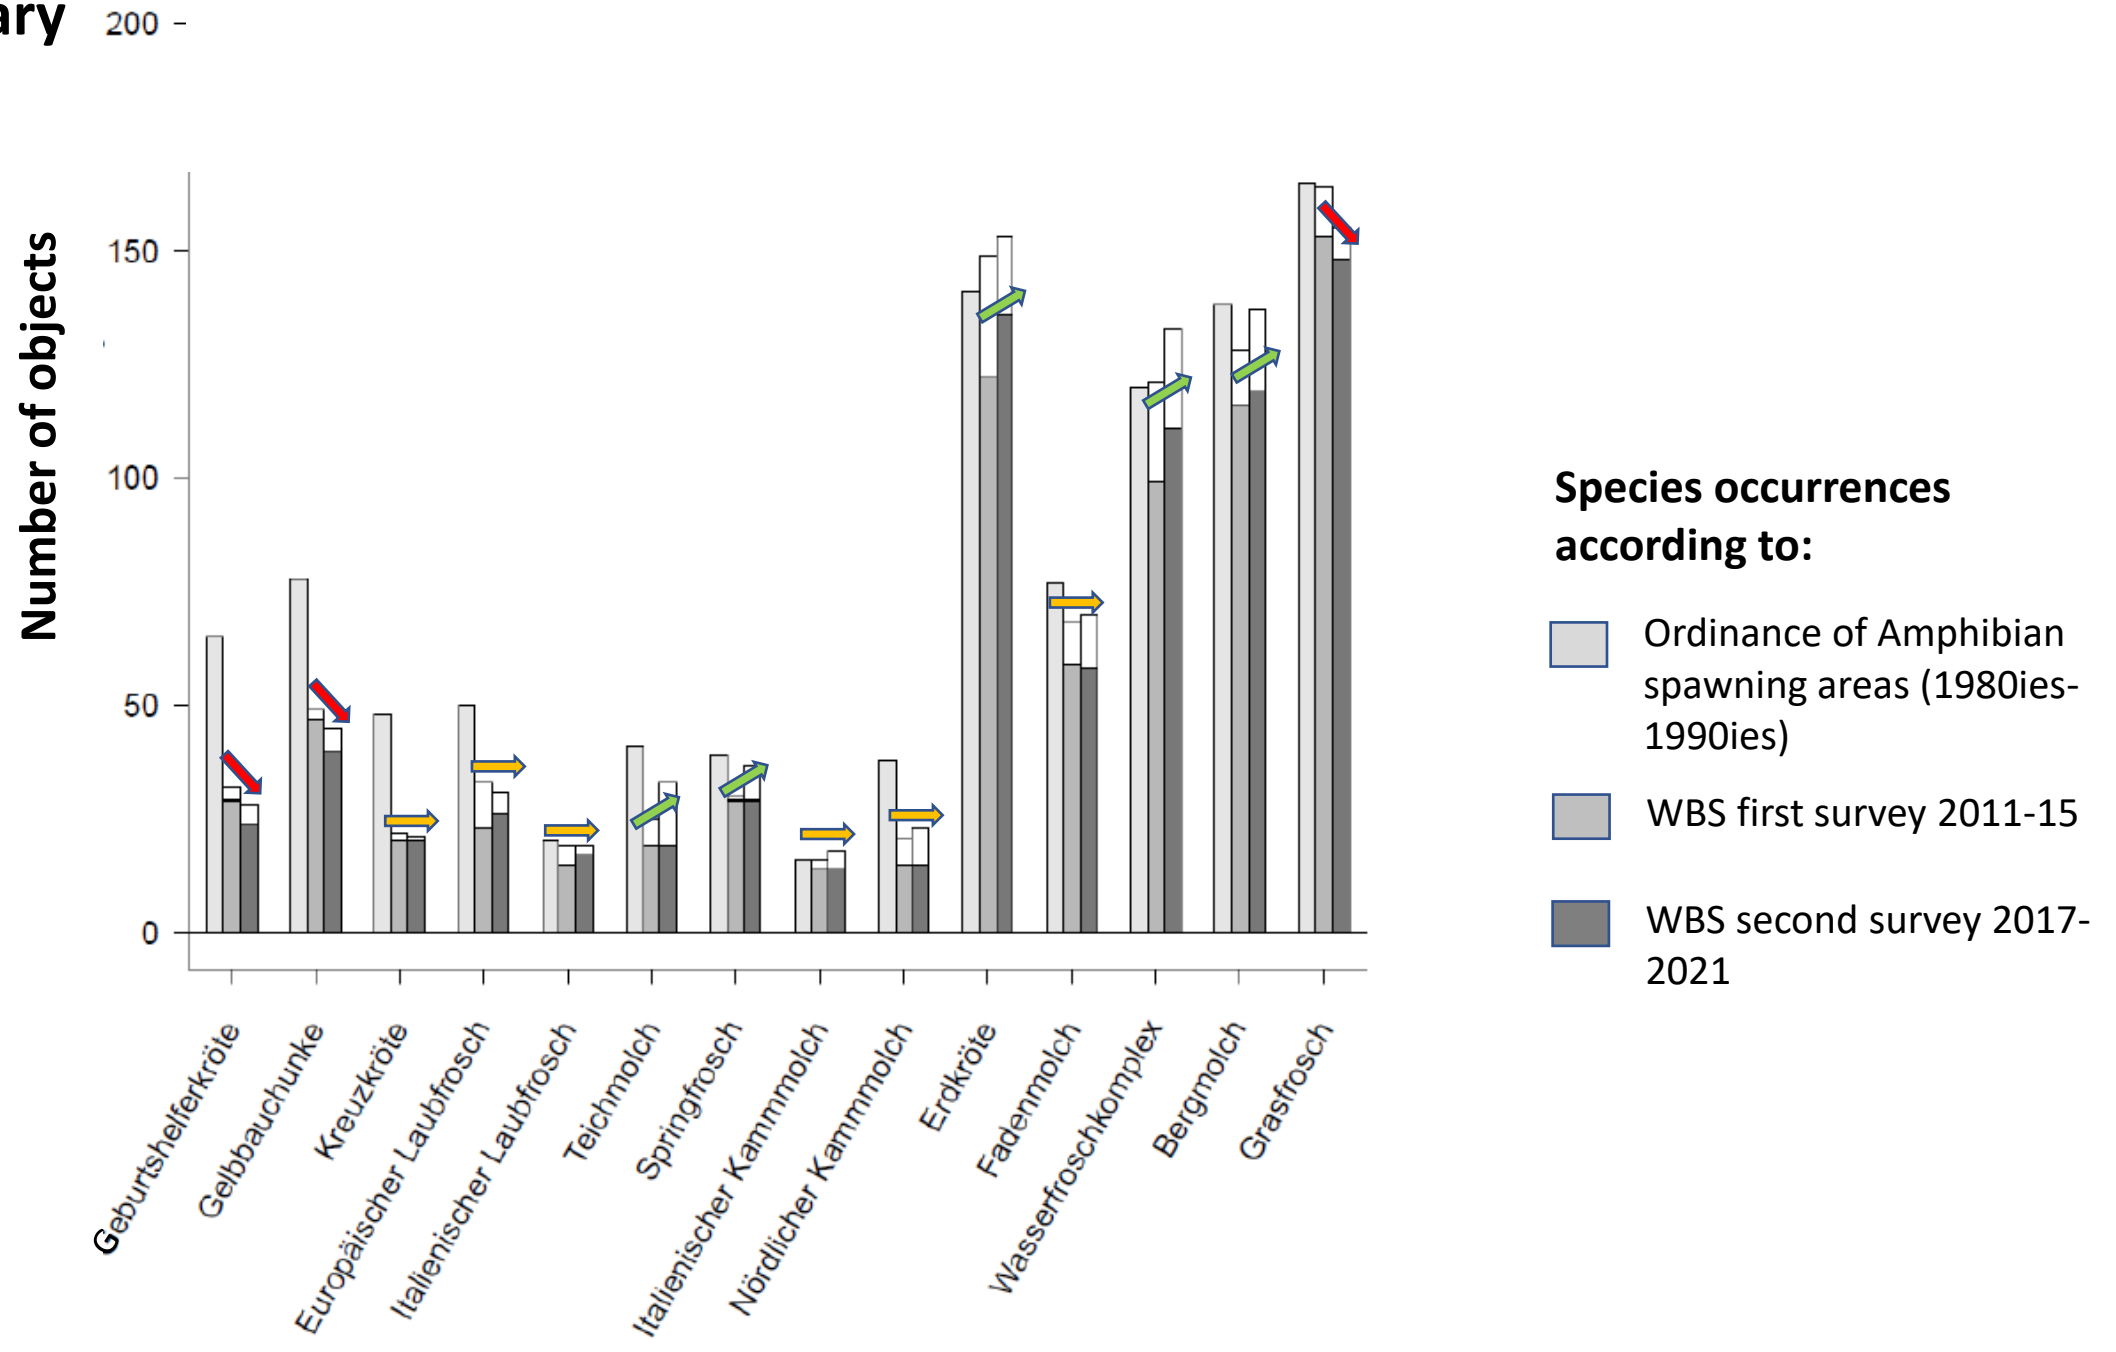

## Amphibian surveys

- 258 objects (215 'ortsfeste' objects, 43 'Wanderobjekte'); Randomly-stratified selection (stratified by biogeographic region and weighed by mean species richness per object within regions)
- Each object is sampled every six years
- (3)-4 surveys within an object per year; high detectability of species

# Preliminary results

# Remote sensing

- Visual interpretation of aerial images
- Interpretation of all 7000 objects of national importance, i.e. no sample
- Two methods:
  - Dry meadows, fens, bogs, amphibian breeding areas, alpine floodplains and glacier forefields: raster interpretation (50 x 50 m grid cells)

## Exemplary results

### Annual changes in the cover of trees and shrubs

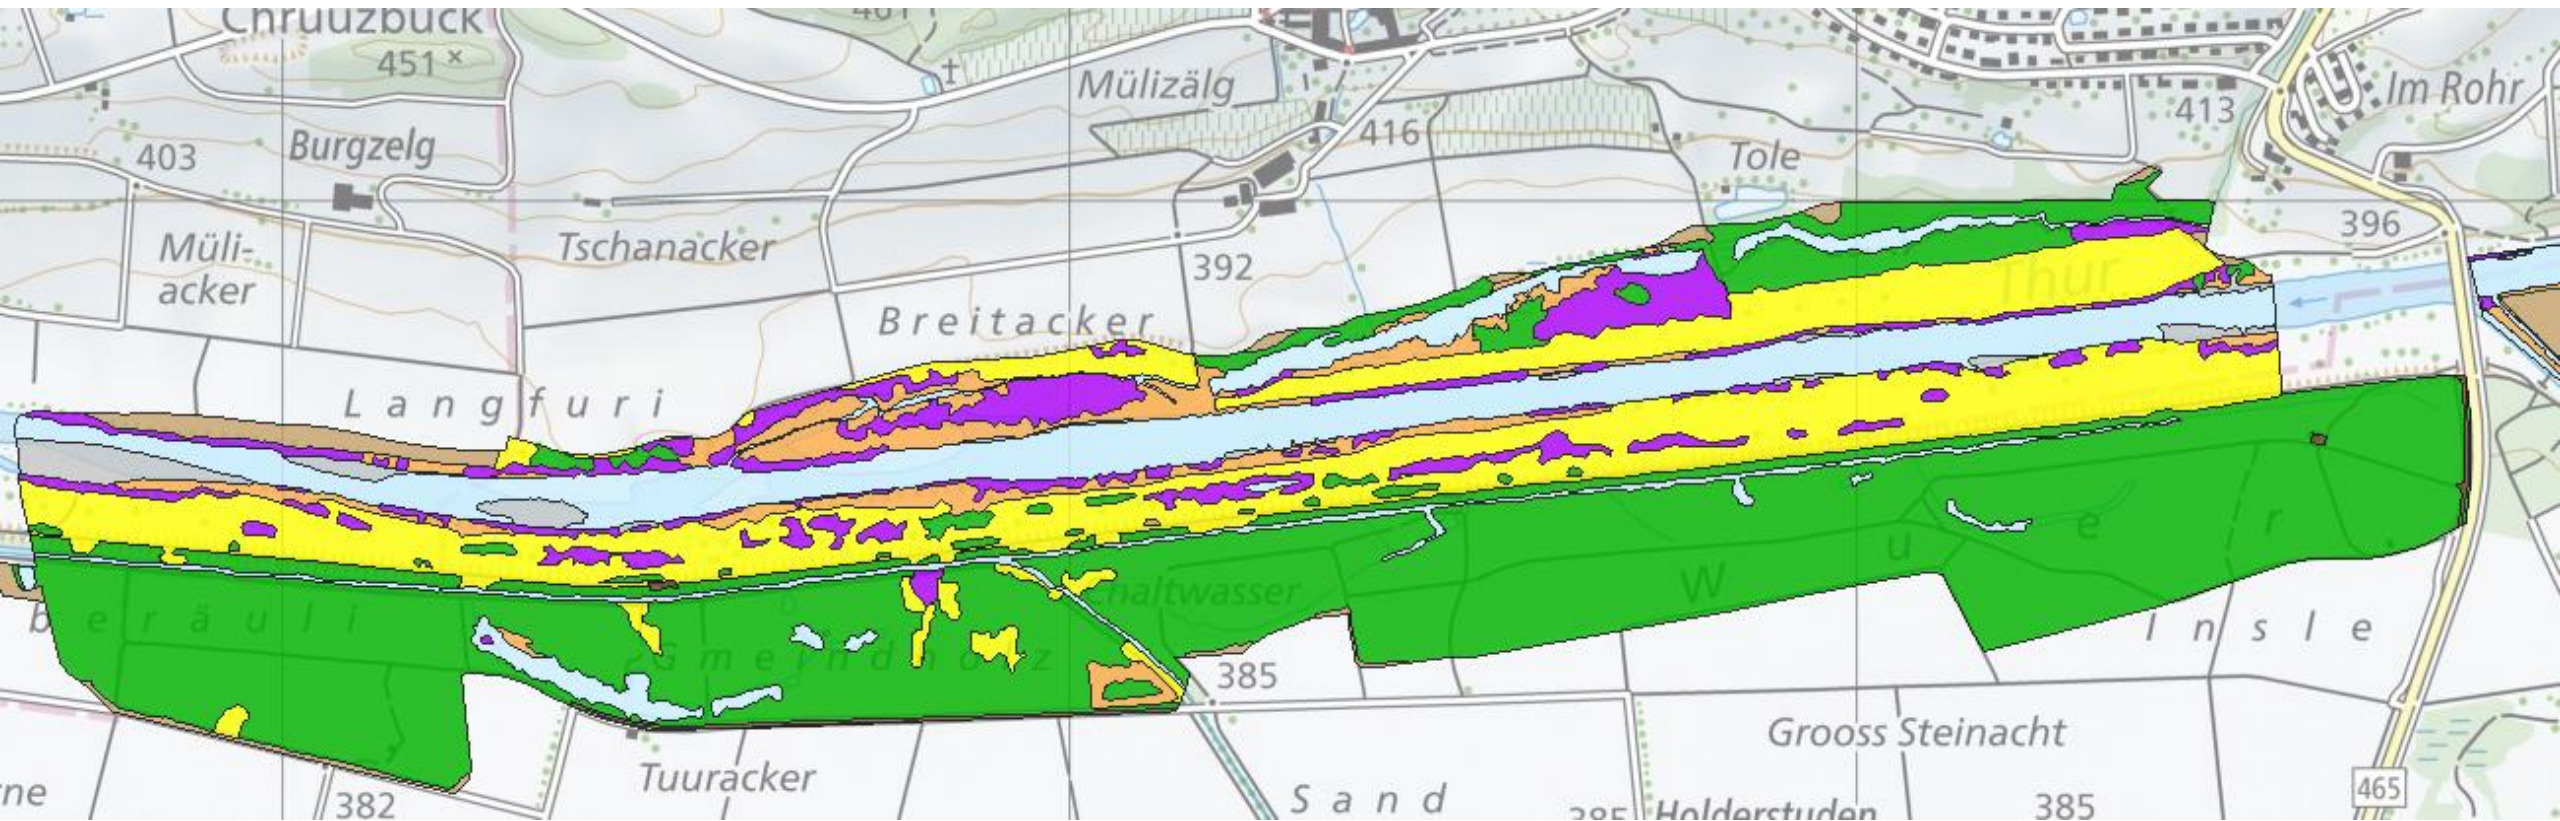

# Remote sensing

- Visual interpretation of aerial images
- Interpretation of all 7000 objects of national importance, i.e. no sample
- Two methods:
  - Dry meadows, fens, bogs, amphibian breeding areas, alpine floodplains and glacier forefields: raster interpretation (50 x 50 m grid cells)
  - Floodplains, deltas, lakeside areas: mapping of so-called 'formations' (rough habitat classes)

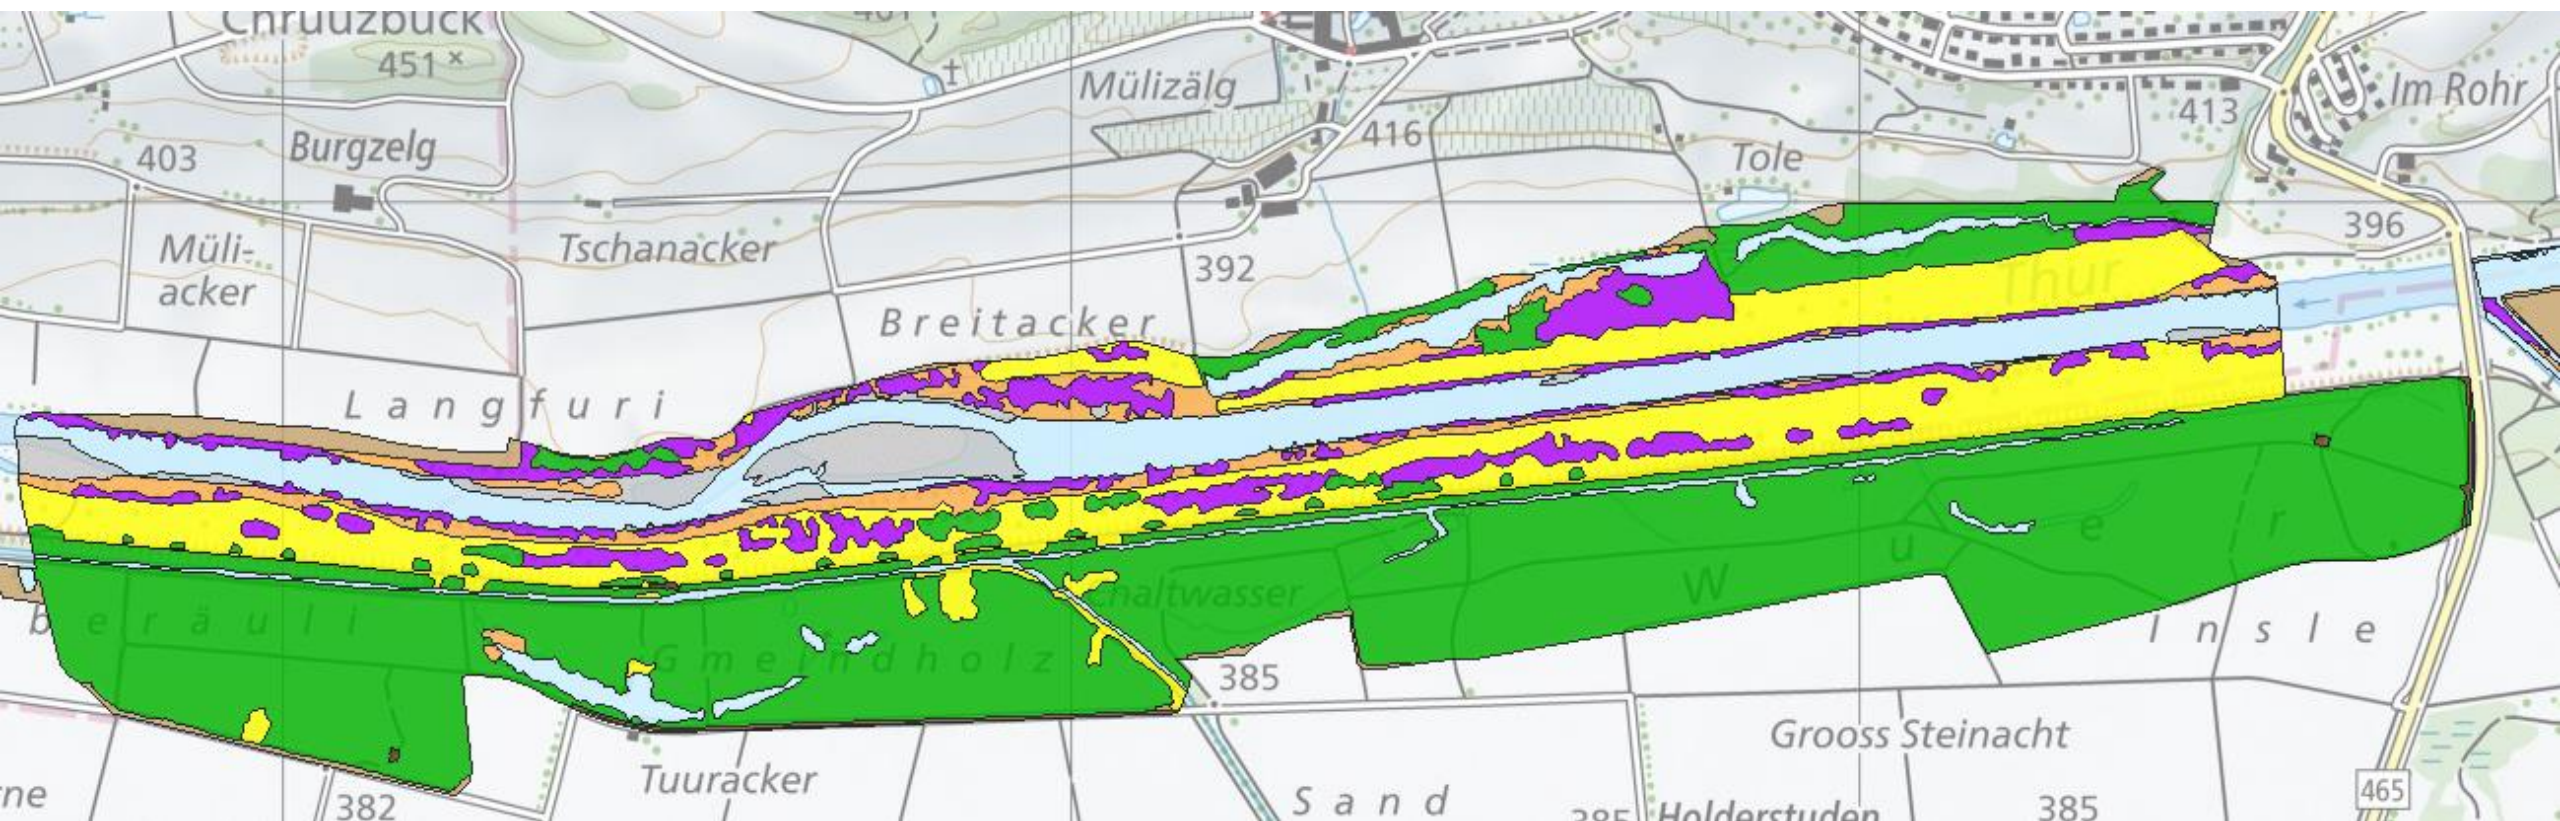

## First survey: 2011

- |  |   |
|--|---|
|  Water  |  Agricultural areas              |
|  Sites without vegetation (e.g. gravel banks) |  Other forest types              |
|  Sites without woody vegetation               |  Other herb-dominated vegetation |
|  Softwood alluvial forest                     |  Rocks                           |
|  Hardwood alluvial forest                     |  Infrastructure (e.g. buildings) |

## Second survey: 2017

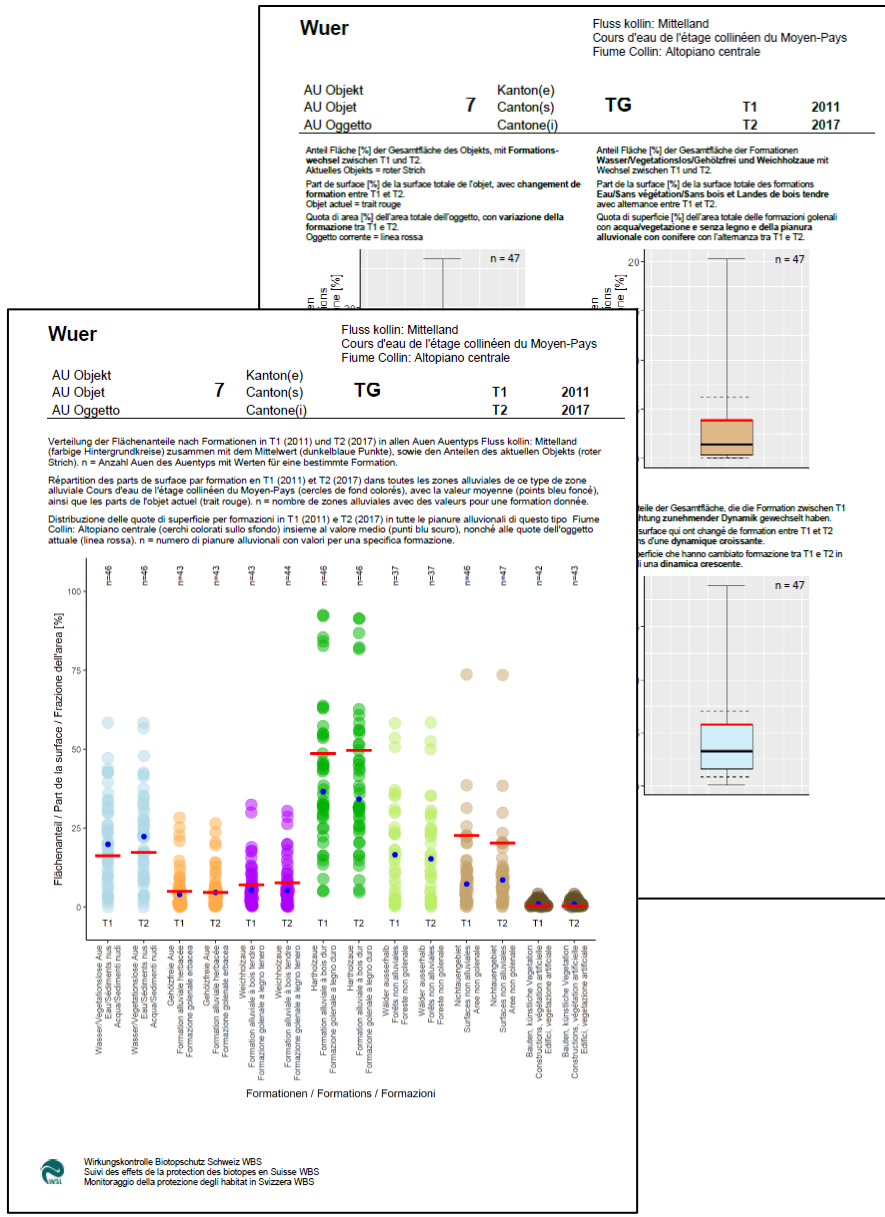

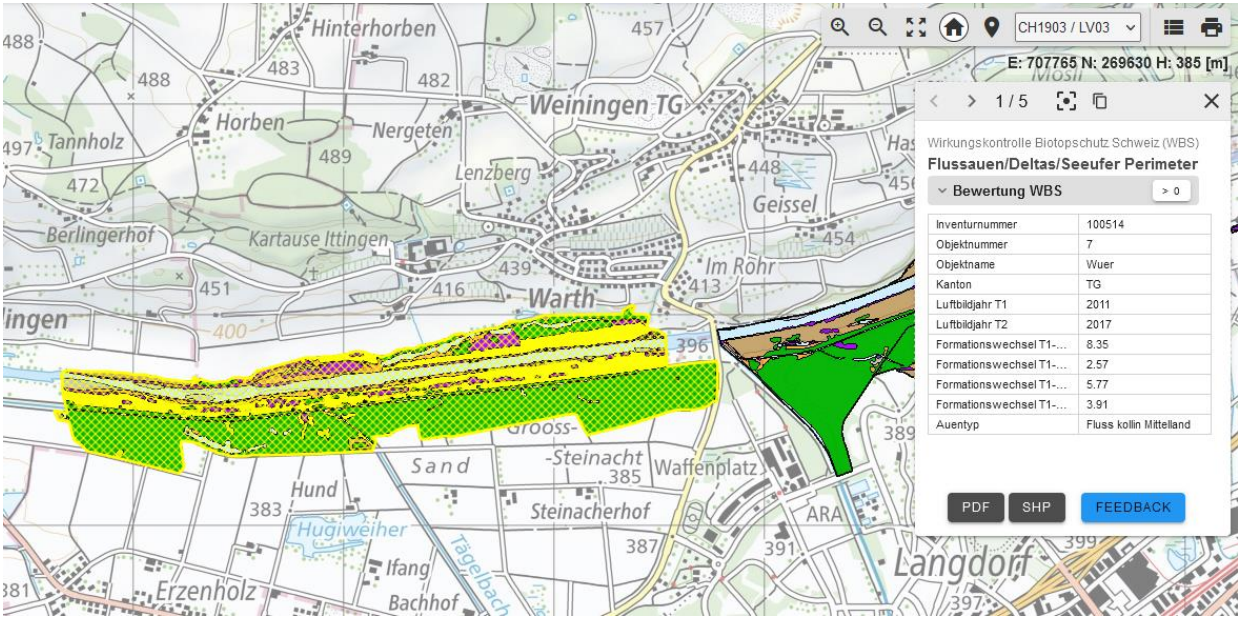

- |  |                                 |
|--|---------------------------------|
| Water  | Agricultural areas              |
| Sites without vegetation (e.g. gravel banks) | Other forest types              |
| Sites without woody vegetation               | Other herb-dominated vegetation |
| Softwood alluvial forest                     | Rocks                           |
| Hardwood alluvial forest                     | Infrastructure (e.g. buildings) |

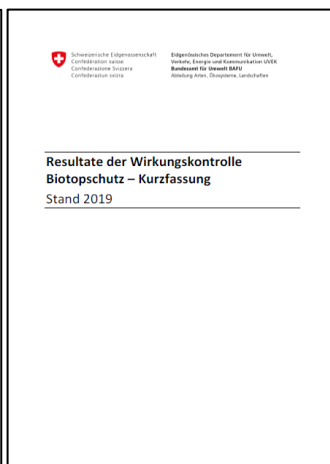

# Availability of data

- All data (remote sensing, vegetation, amphibian data) are available for the cantons (via virtual data center)
- Vegetation data and amphibian data also stored in the national data centers (infoflora, infofauna, Swissbryophytes)
- If interested in scientific analyses, contact us, we're happy to collaborate

Dossiers for each object for cantons in virtual data center
