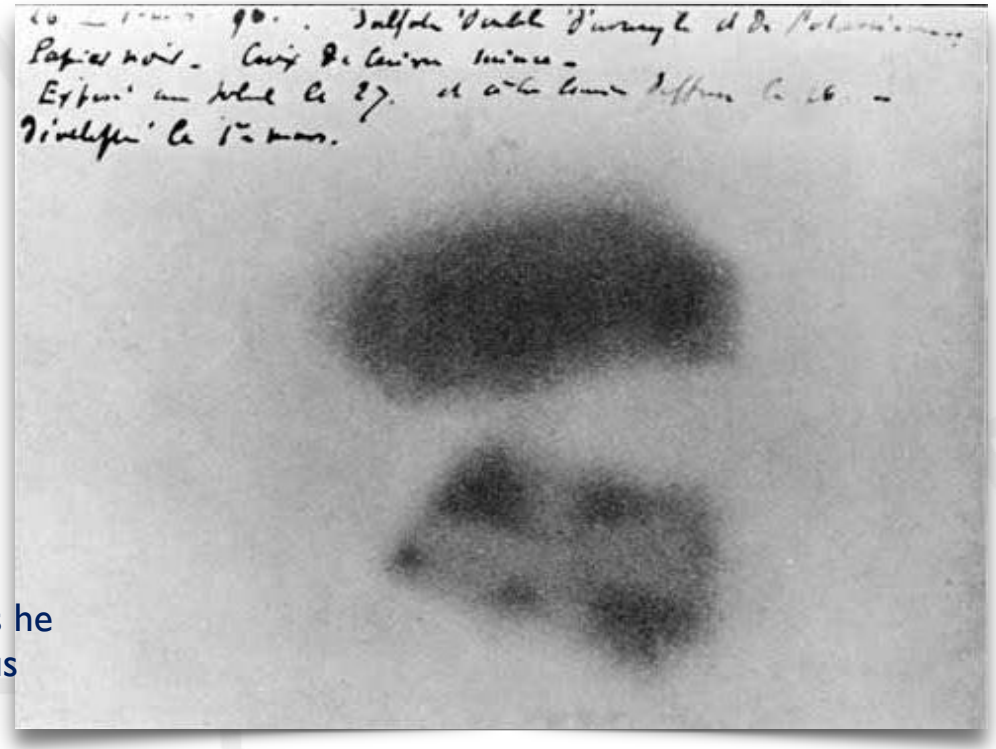
1896 — Discovery of radioactivity

Antoine Henri Becquerel

* 15. Dezember 1852 in Paris
† 25. August 1908 in Le Croisic

Nobel Prize 1903

„in recognition of the extraordinary services he has rendered by his discovery of spontaneous radioactivity“

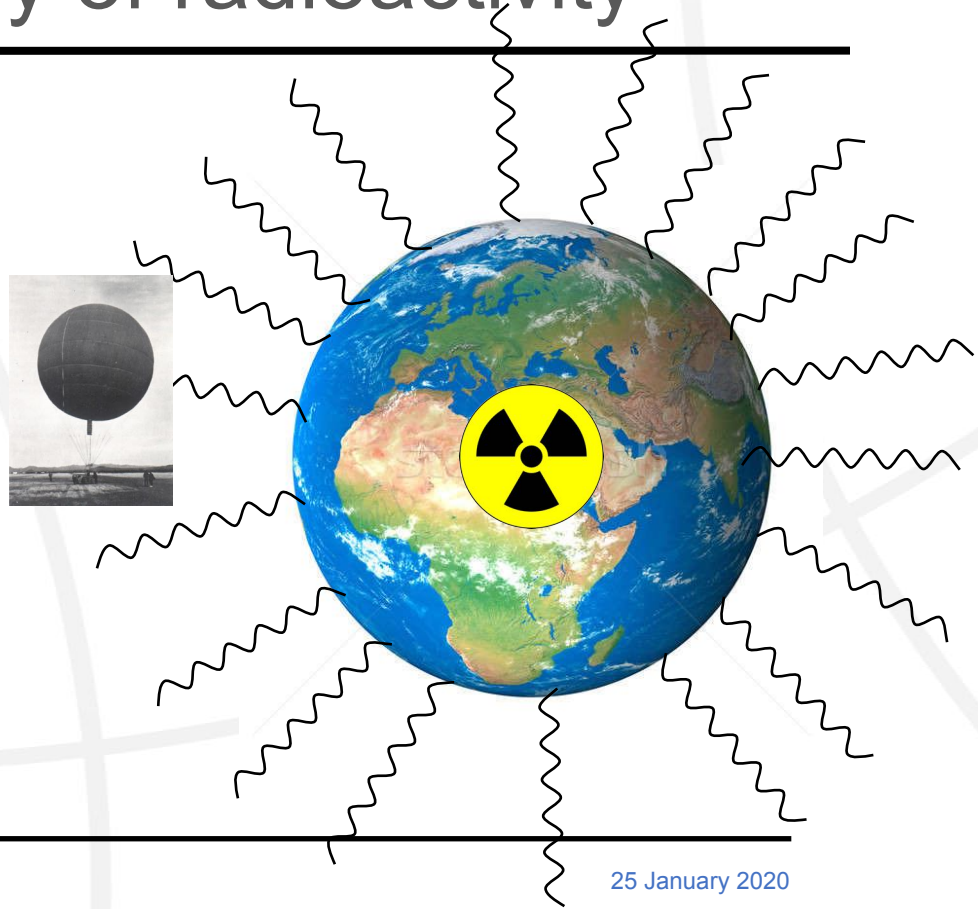


Early 1900's — Study of radioactivity

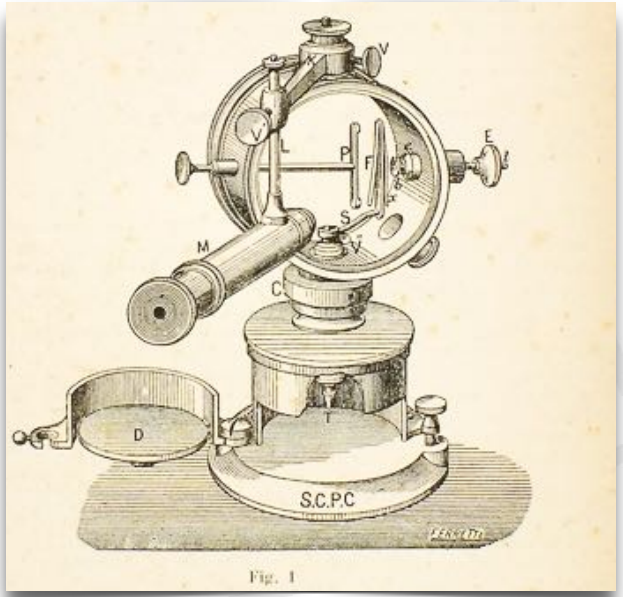
Radioactivity was discovered by **Becquerel** in **1896**, and studied further by **Marie Curie** and many others.

Earth is recognised as a **radioactive ball**.

Radioactivity measured in the atmosphere should get less when going further away from Earth.



Measuring radioactivity in the early 1900's

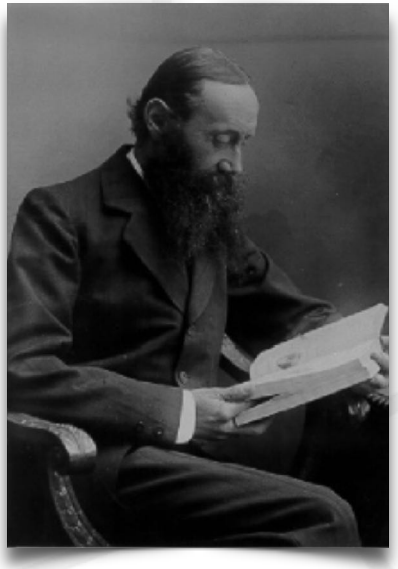


With an electrometer, measuring discharge between two charged wires, radioactivity was measured in that time. Painstakingly !

Pioneers of the detection of cosmic rays

Karl Bergwitz (1875-1958), Germany
Decrease of radioactivity at 1300 m to 24%

Balloon flights in 1909



Albert Gockel (1860-1927), Professor in Fribourg
No decrease, maybe increase of radioactivity at 4500m.
Introduced the term 'cosmic radiation'

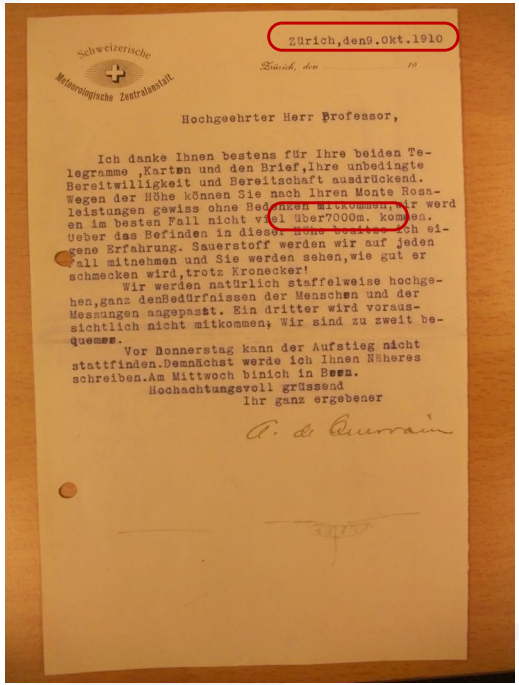
No hydrogen for Gockel to go higher

At that time,
gas balloons were used.

With methane, maximum altitude is limited.

With hydrogen, high altitudes were possible.

Gockel was first promised, then refused the hydrogen.



Schweizerische Meteorologische Zentralanstalt.

Zürich, den 9. Okt. 1910

Hochgeehrter Herr Professor,

Ich danke Ihnen bestens für Ihre beiden Telegramme, Karten und den Brief, Ihre unbedingte Bereitwilligkeit und Bereitschaft ausdrückend. Wegen der Höhe können Sie nach Ihren Monte Rosaleistungen gewiss ohne Bedenken mitkommen, wir werden im besten Fall nicht viel über 7000m. kommen. Ueber das Befinden in dieser Höhe besitze ich eigene Erfahrung. Sauerstoff werden wir auf jeden Fall mitnehmen und Sie werden sehen, wie gut er schmecken wird, trotz Kronecker!

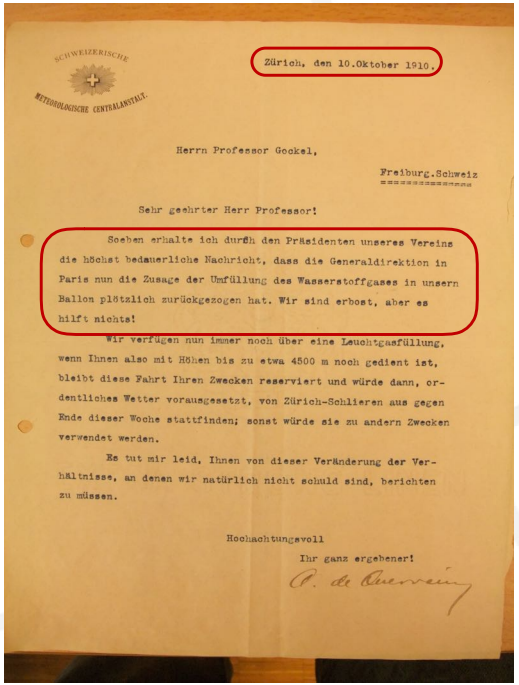
Wir werden natürlich staffelweise hochgehen, ganz den Bedürfnissen der Menschen und der Messungen angepasst. Ein dritter wird voraussichtlich nicht mitkommen; Wir sind zu zweit bequemer.

Vor Donnerstag kann der Aufstieg nicht stattfinden. Demnächst werde ich Ihnen Näheres schreiben. Am Mittwoch bin ich in Bern.

Hochachtungsvoll grüssend

Ihr ganz ergebener

A. de Quervain



Schweizerische Meteorologische Centralanstalt.

Zürich, den 10. Oktober 1910.

Herrn Professor Gockel,

Freiburg. Schweiz

Sehr geehrter Herr Professor!

Soeben erhalte ich durch den Präsidenten unseres Vereins die höchst bedauerliche Nachricht, dass die Generaldirektion in Paris nun die Zusage der Umfüllung des Wasserstoffgases in unsern Ballon plötzlich zurückgezogen hat. Wir sind erbost, aber es hilft nichts!

Wir verfügen nun immer noch über eine Leuchtgasfüllung, wenn Ihnen also mit Höhen bis zu etwa 4500 m noch gedient ist, bleibt diese Fahrt Ihren Zwecken reserviert und würde dann, ordentliches Wetter vorausgesetzt, von Zürich-Schlieren aus gegen Ende dieser Woche stattfinden; sonst würde sie zu andern Zwecken verwendet werden.

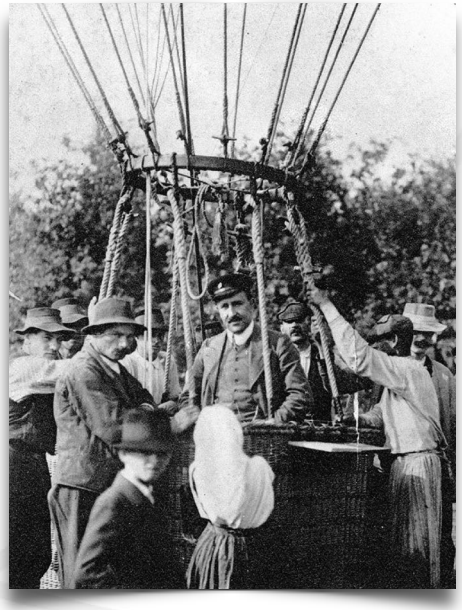
Es tut mir leid, Ihnen von dieser Veränderung der Verhältnisse, an denen wir natürlich nicht schuld sind, berichten zu müssen.

Hochachtungsvoll

Ihr ganz ergebener!

A. de Quervain

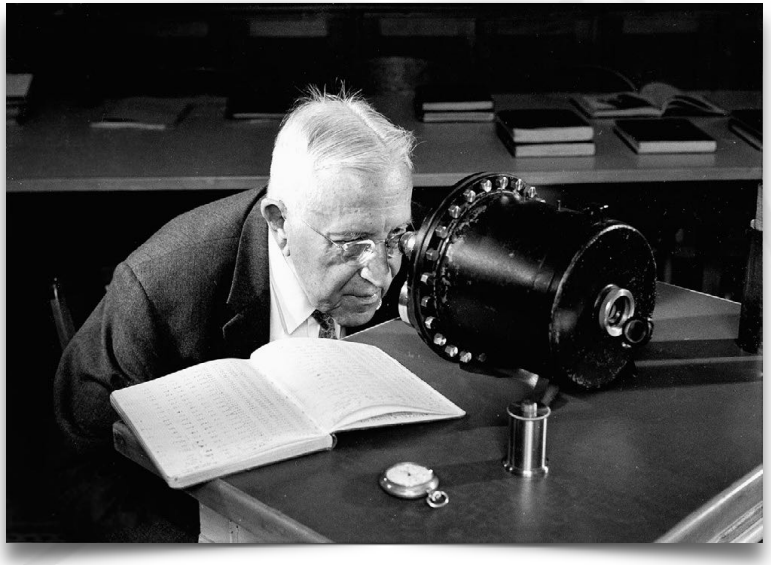
Pioneers of the detection of cosmic rays



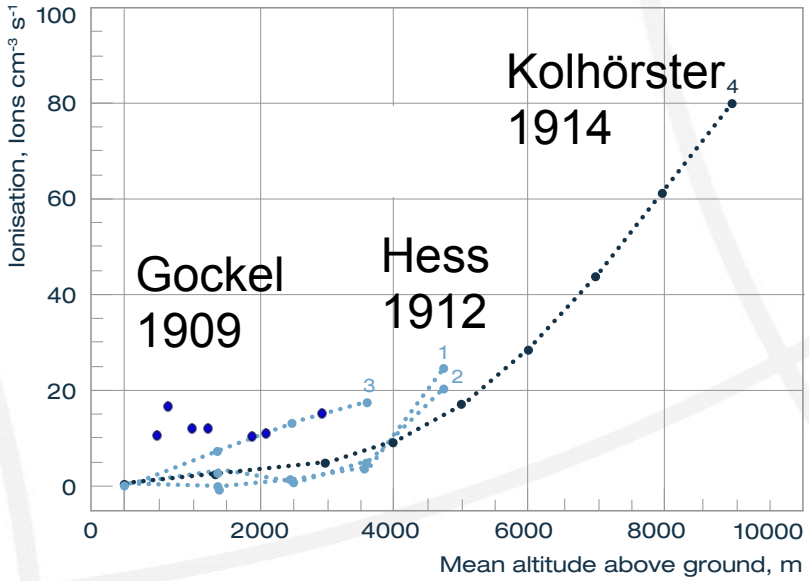
Victor Hess (1883-1964)
Professor in Graz reached 5300 m in 1912

Werner Kolhörster (1887-1945)
Professor in Berlin reached 9300 m in 1914

Detection of cosmic rays



Ionisation of air increases with altitude.



Victor Hess with his device
Nobel prize in 1936.
Albert Gockel died already in 1927 and could not be awarded.

cosmic rays from the top

3 times higher rate at 4000m than at 1000m

cosmic rays at 45°

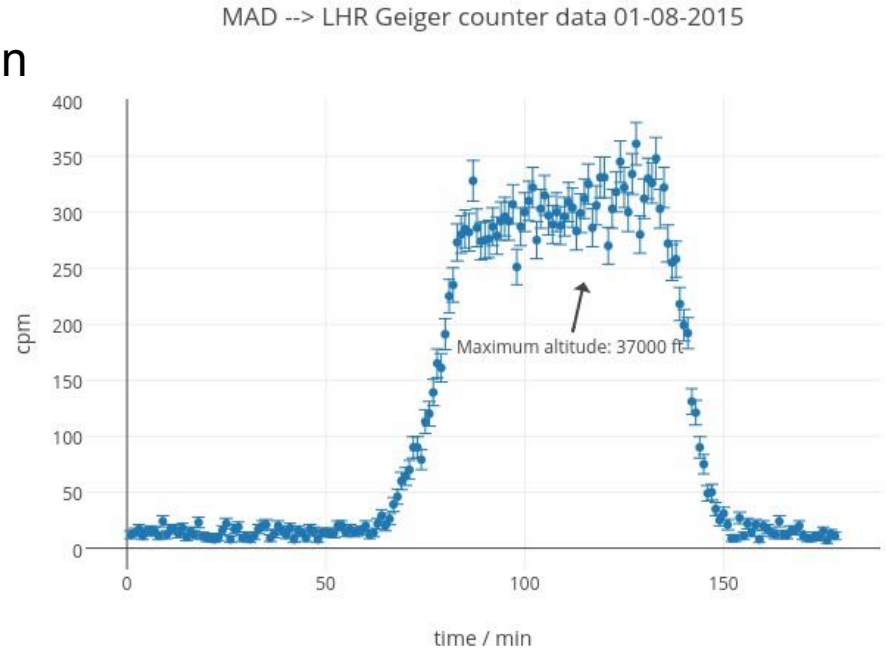
1.5 times higher rate at 4000m than at 1000m

Taking a Geiger Counter on board of an airplane

20 times higher background radiation in standard cruising altitude than at ground level.

ca 6 µS/h

Fukushima radiation map
https://jciv.iidj.net/map
Comparable to the hot zones.
E.g. Ōkuma is evacuated and has ca 4.5 µS/h

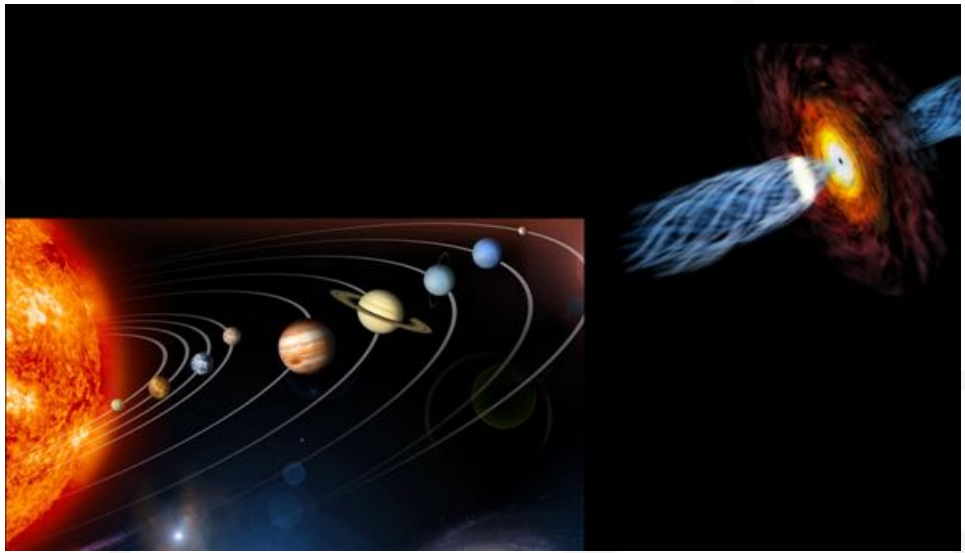


Where do cosmic rays come from?

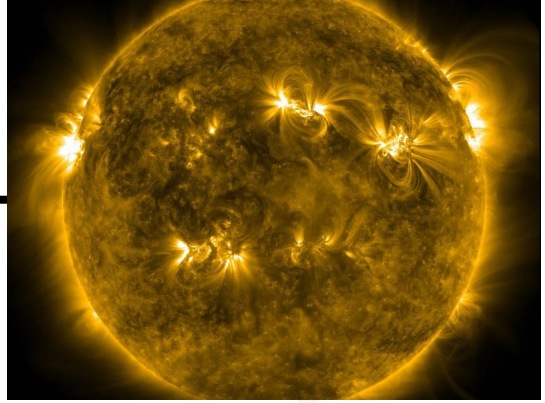
Earth is constantly hit by particles.

Most come from the **sun**.
They have moderately **low energies**.

Active galactic nuclei, **neutron stars**, **supernovae**, deep in the **Milky Way** and **in far away galaxies**, create particles at **extremely high energies**.



Aurora Borealis

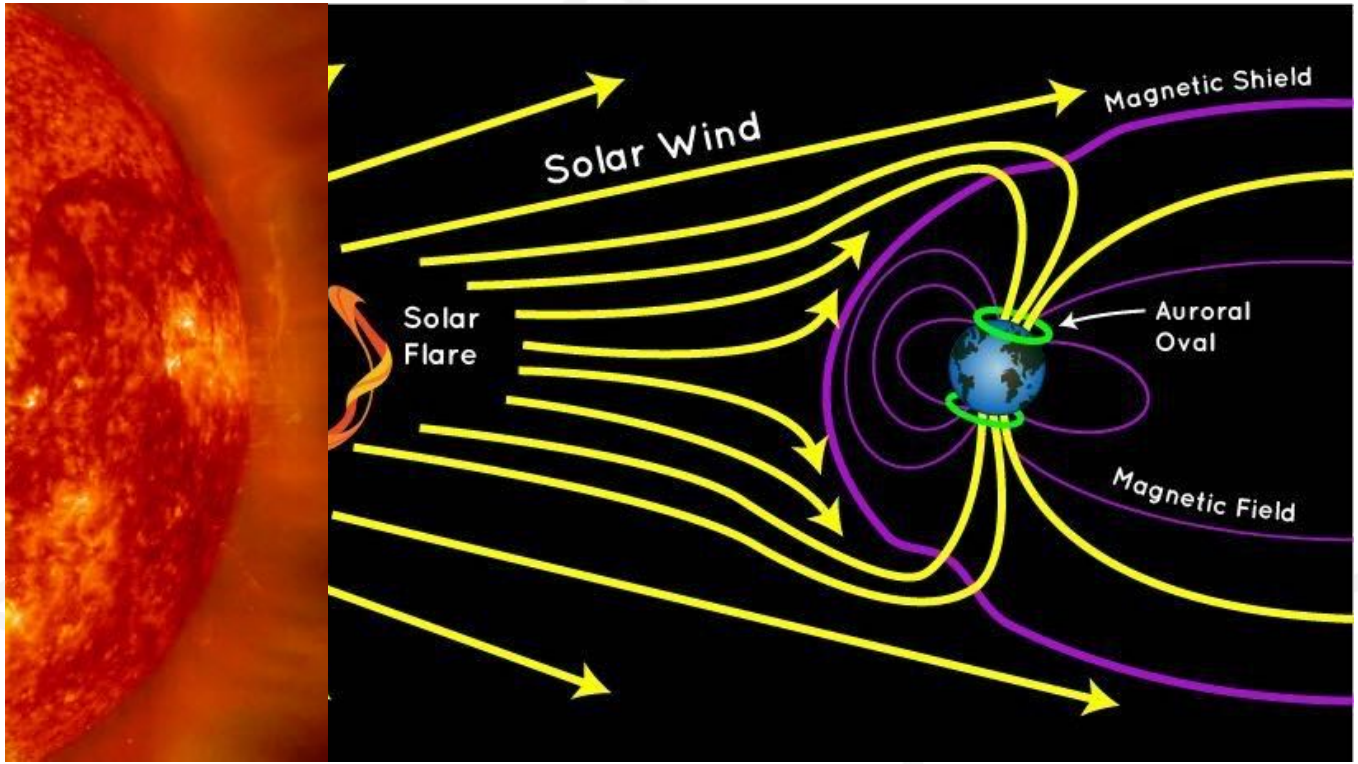


The sun's **solar wind is composed of particles** protons, electrons, helium nuclei,…

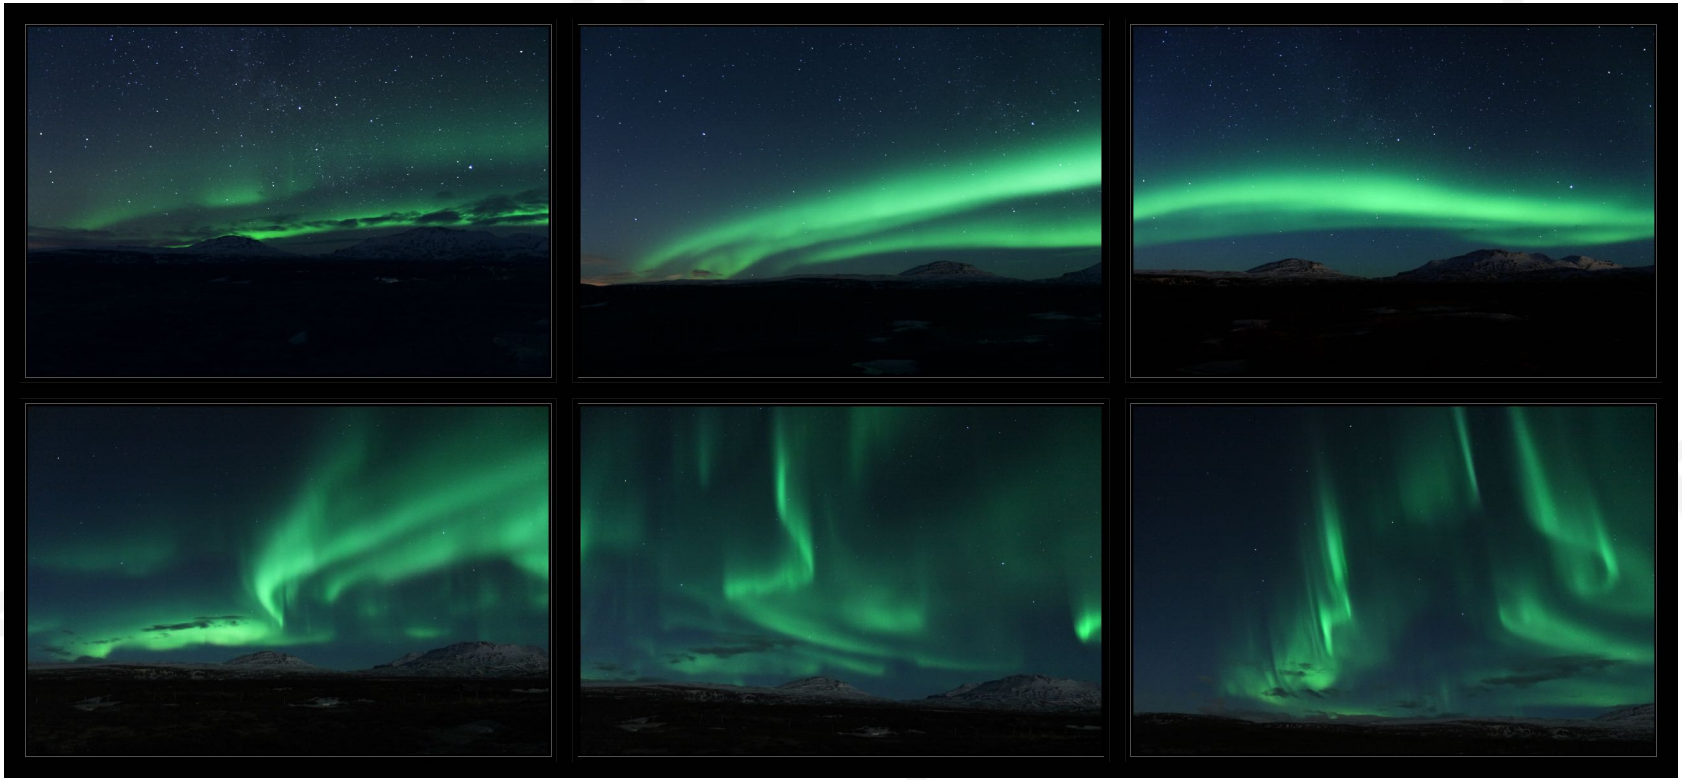
As the energy of these is moderately low, the **Earth's magnetic field deflects** them — except in the polar regions.

When the sun is ejecting a **solar flare**, it becomes visible with the naked eye in the polar regions.

Earth’s magnetic field deflects the solar wind



Aurora Borealis (North Pole) and Australis (South Pole)



High energetic particles hit Earth everywhere

Active galactic nuclei, **neutron stars**, **supernovae**, deep in the Milky Way and **in far away galaxies**, create particles at extremely high energies.

Some of these are also hitting the Earth.

Why study Cosmic Rays ?

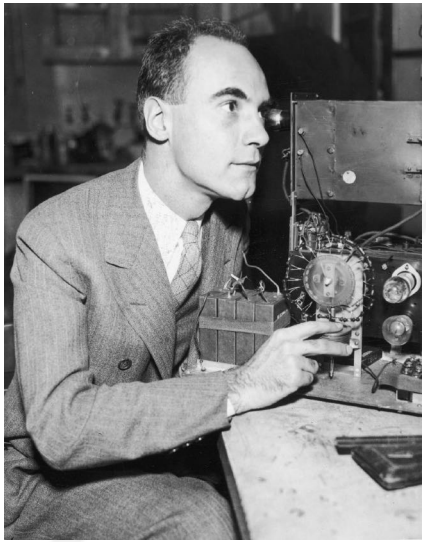
The **Universe** is emitting **light** - which we see with the **naked eye** and through **telescopes**.

Fascinating humankind since ever.

The **Universe** is also emitting **particles**, giving a **broader view** and **new insights**.

Fascinating even more. **Particle physics is also cosmology.**

Studying Cosmic Rays — the early days



Carl David Anderson
Discovered **anti-matter in 1932**
(the positron, which is the anti-electron)
Nobel Prize 1936

High altitude research station
at the Jungfraujoch 3500m
Since the mid 1920's.

Studying Cosmic Rays — still today

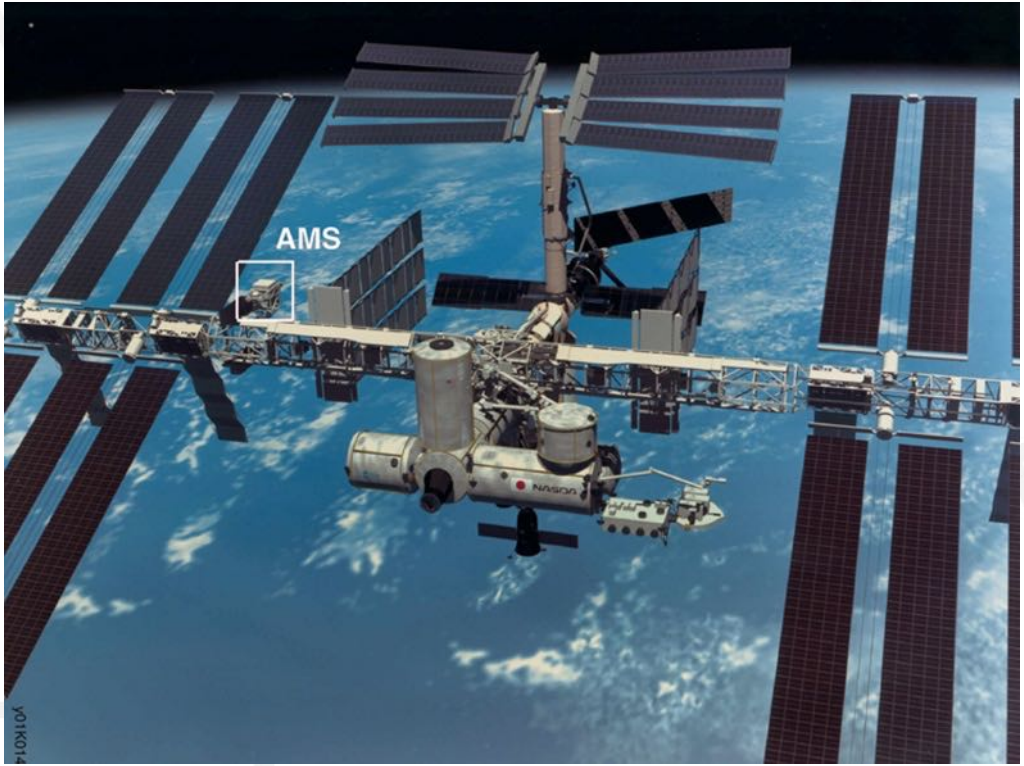
On ground

3000 km^2 array in Malargüe, Mendoza prov., Argentina

Studying Cosmic Rays — still today

In space

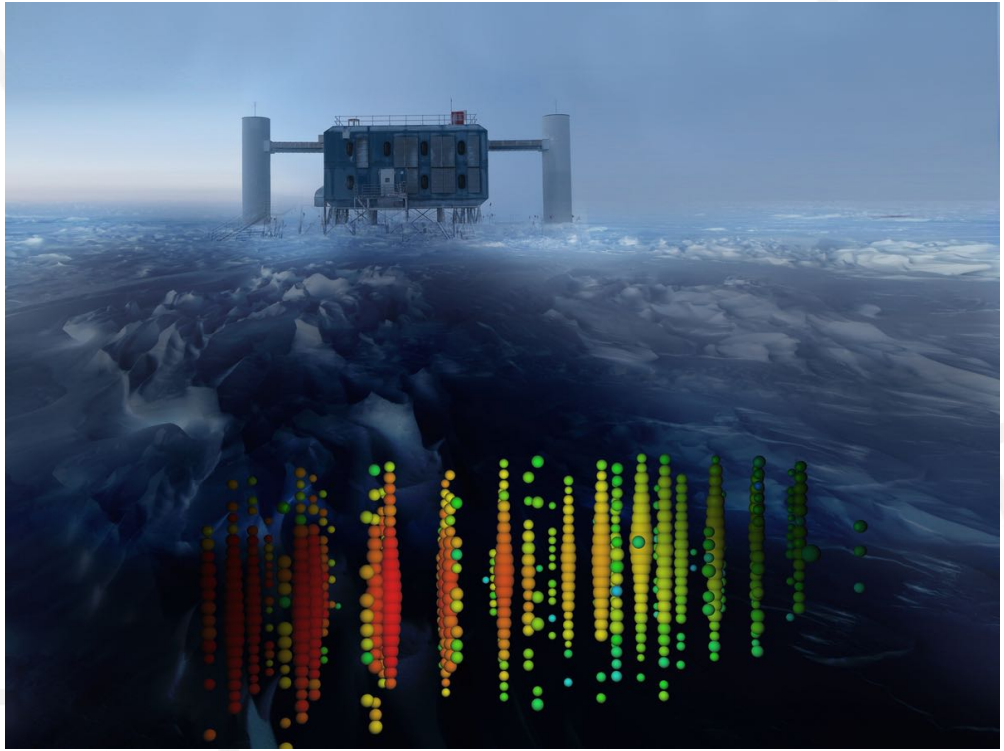
On the international space station



Studying Cosmic Rays — still today

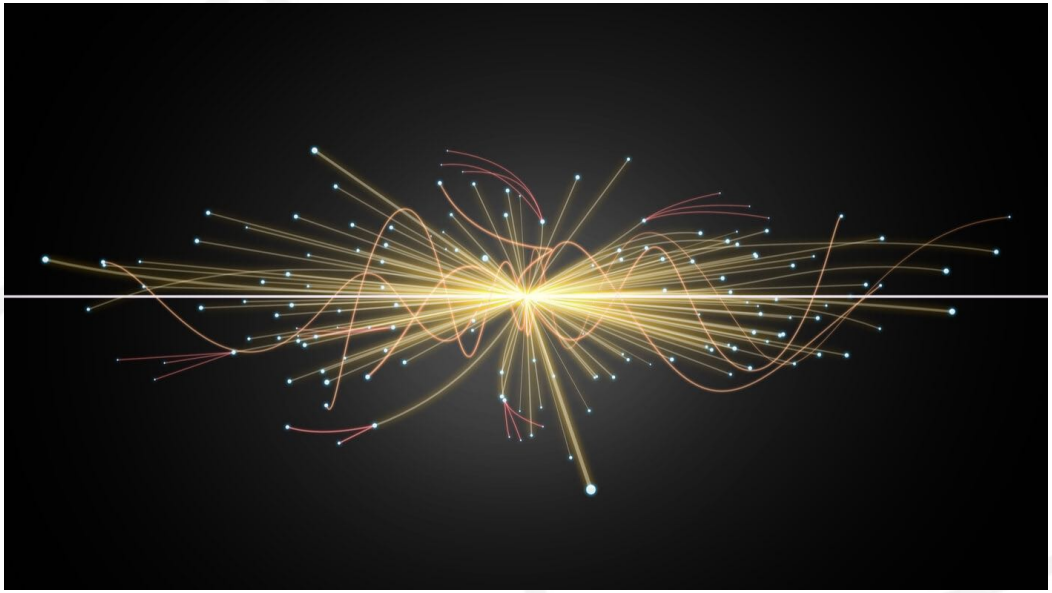
Below ground

In the ice at the South Pole



Understanding particle collisions

Proton

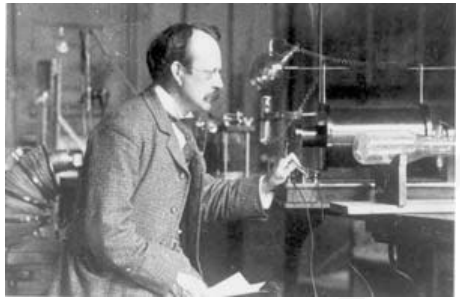


Proton

At **CERN**, particles are brought to collisions

- as cosmic rays collide with the atmosphere
- gives insight in the inner forces of matter

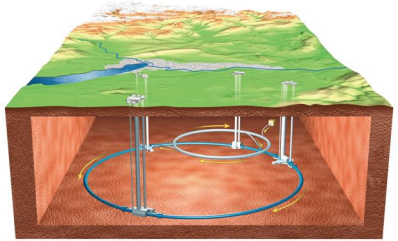
120 years of accelerating particles



1897 Accelerating electrons
Cathode ray tube
J.J. Thomson

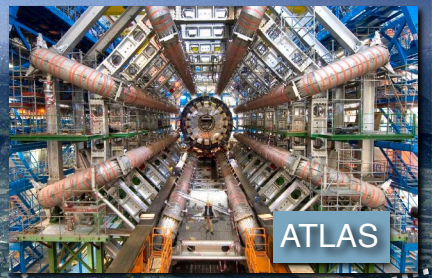
1931 First circular accelerator
Ernest O. Lawrence & M. Stanley Livingston

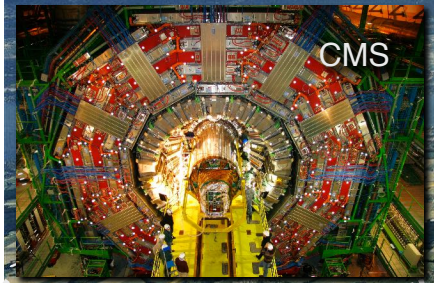
1940



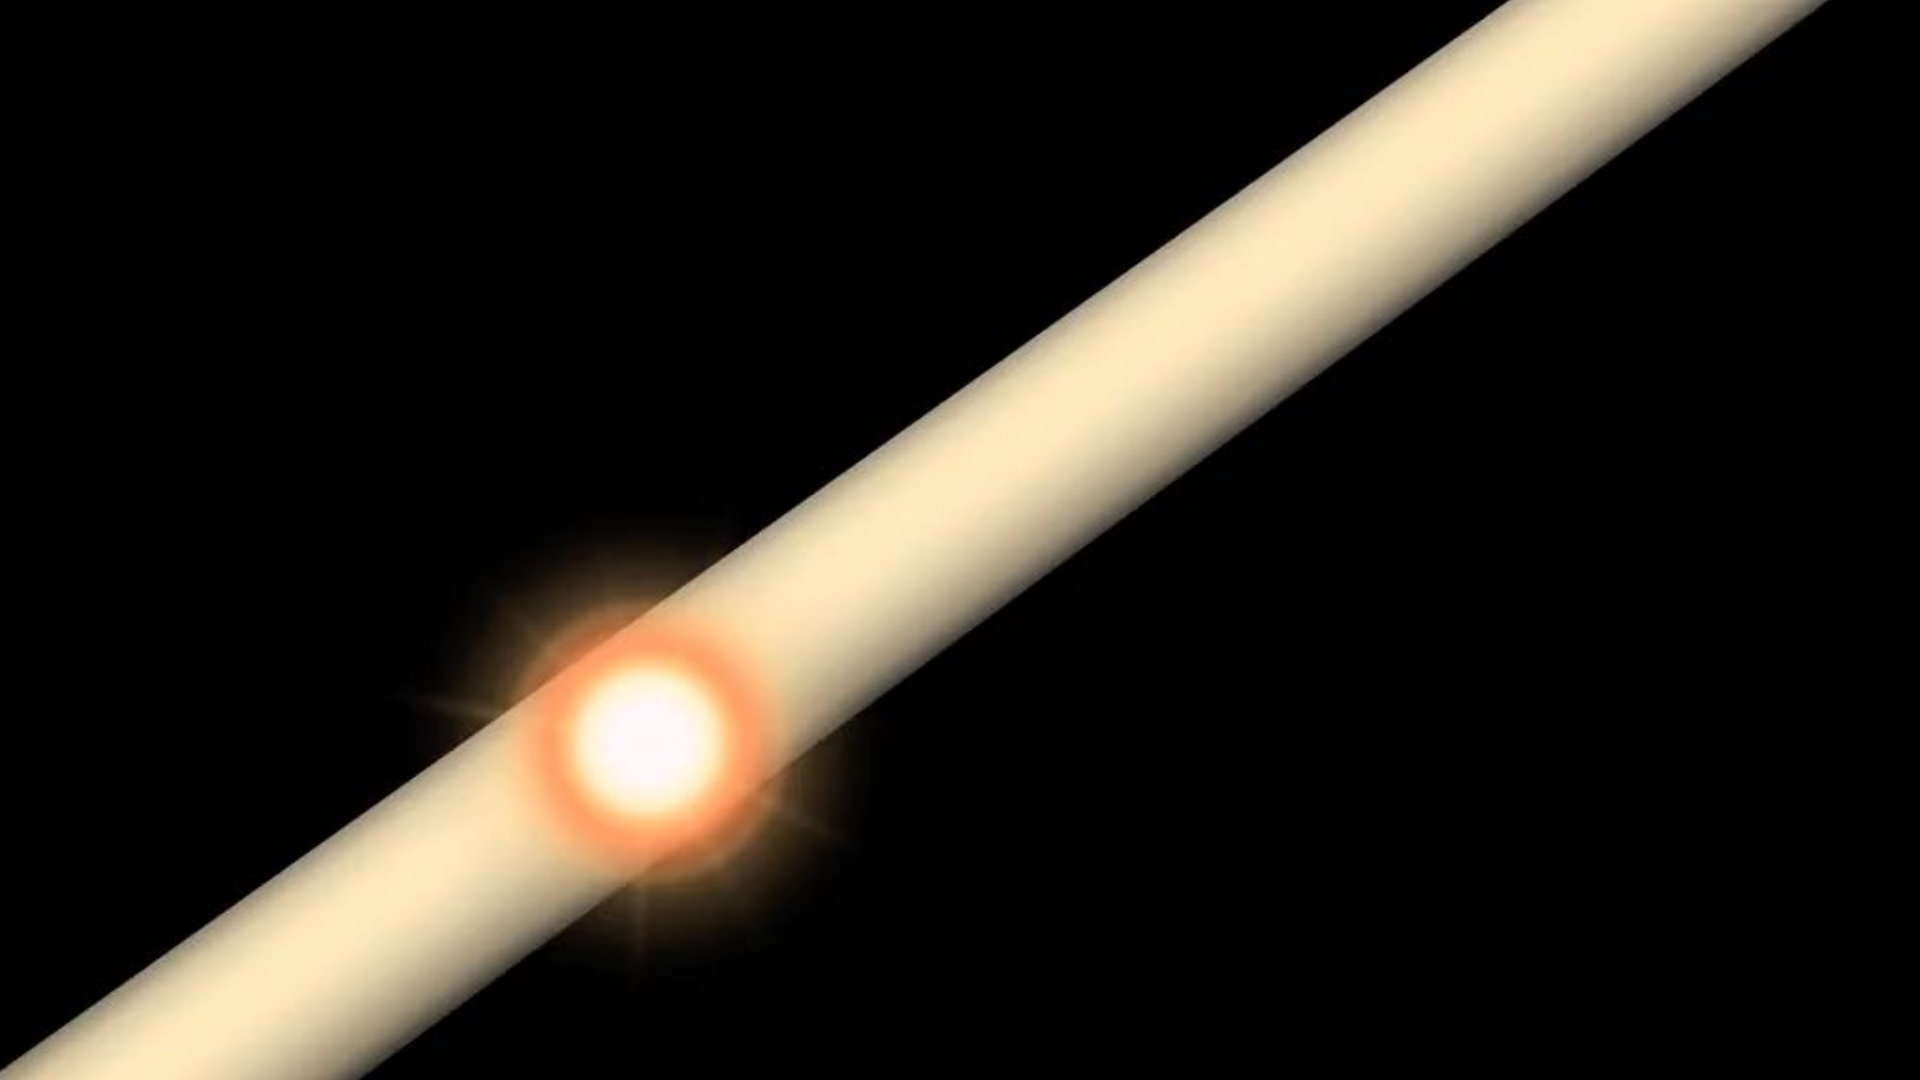
Today: LHC

CERN — Large Hadron Collider

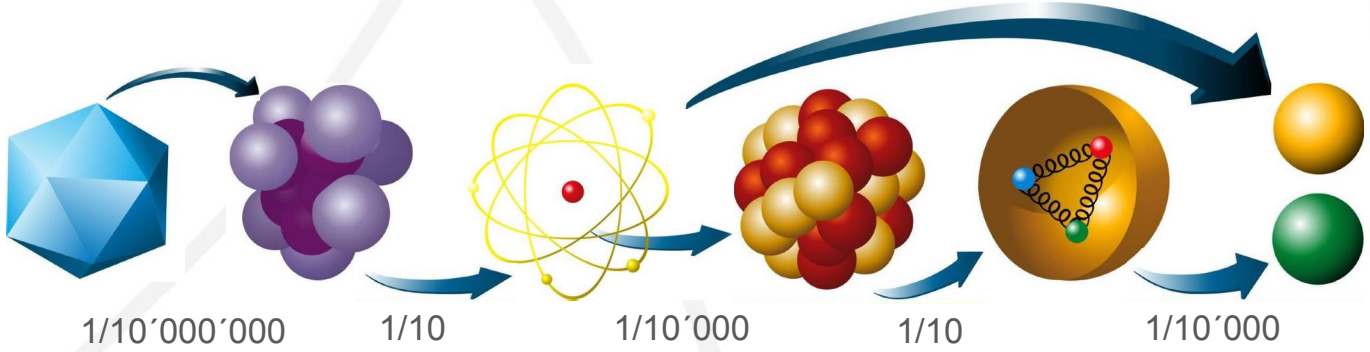




Exploration of a new energy frontier
in p-p and Pb-Pb collisions



The structure of matter revealed



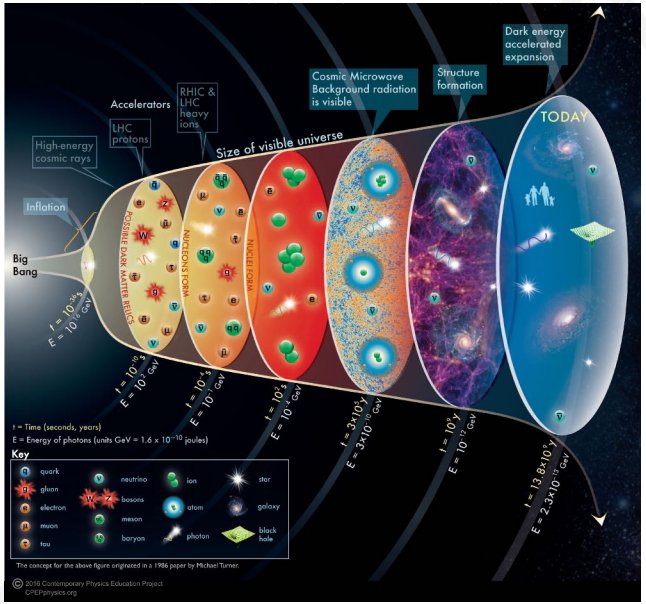
Pinhead:
10^{-3} m = 0,001 m

Atom
10^{-10} m

Electron, Quark:
< 10^{-19} m = 0,000´000´000´000´000´000´1 m
(no further inner structure ??? Who knows?)

If an atom's radius would be as large as the distance from CERN to Copenhagen, the LHC could still resolve millimetre scale objects.

The evolution of the Universe



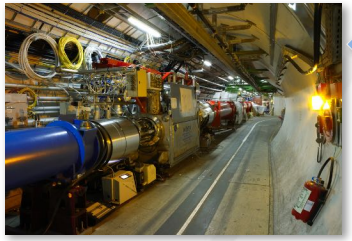
$$\mathcal{L} = -\tfrac{1}{4}\mathcal{F}_{\mu\nu}\mathcal{F}^{\mu\nu} + i\bar{\psi}\not{\mathcal{D}}\psi + \psi_i y_{ij}\psi_j\phi + h.c. + \left|\mathcal{D}_\mu\phi\right|^2 - \mathcal{V}(\phi)$$

The Standard Model of Particle Physics

Balloons played an important role in the beginning

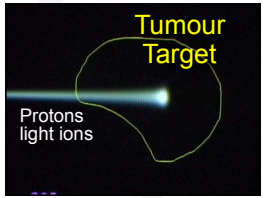
on the way to deeply understand the **Universe**, and with it, **who we are**, where we are **coming from**, and where we are **going to**.

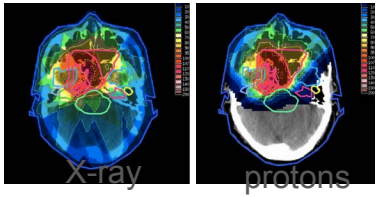
Medical Application as an Example of Particle Physics Spin-off
Combining Physics, ICT, Biology and Medicine to fight cancer



Accelerating particle beams
~30'000 accelerators worldwide
~17'000 used for medicine

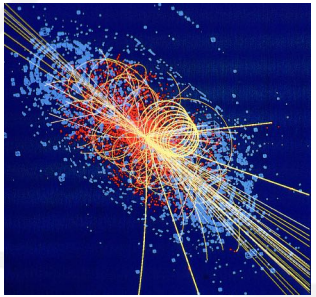
Hadron Therapy





Leadership in Ion Beam Therapy now in Europe and Japan

>100'000 patients treated worldwide (45 facilities)
>50'000 patients treated in Europe (14 facilities)



Detecting particles

Imaging

Clinical trial in Portugal, France and Italy for new breast imaging system (ClearPEM)

PET Scanner
