

PANDANUS TALUUCENSIS

Pandanus taluucensis Callm., 2011: Blütenpflanze (Familie Pandanaceae) – neu entdeckte Art aus Neukaledonien.

Dieses Strauchgewächs wird 1 bis 3 Meter hoch und ist somit nicht leicht zu übersehen. Es wurde trotzdem erst im Jahre 2011 entdeckt, da es nur auf einem Gebiet von weniger als 10 km² wächst, und zwar auf den höchsten Gipfeln des Massif du Panié. Es gilt als vom Aussterben bedroht, wie viele weitere neu entdeckte Arten.
